

# Interactive Design for Smart Devices

Visual design

# Goals of Visual Design

2

- Help users find their way
  - Learnability
  - Memory
  - Few errors
  - Efficient
- Provide a distinct look and feel
  - Satisfaction

Topics include:

Color • Contrast • Grouping • Simplicity

# Goals of Visual Design

3

Visual design aims to shape and improve the user experience through considering the effects of illustrations, photography, typography, space, layouts, and color on the *usability* of products and on their *aesthetic appeal*.

To help designers achieve this, visual design considers a variety of principles, including Gestalt properties, space, hierarchy, balance, contrast, scale, dominance, and similarity.

# Review of Colour Guidelines

4

- Avoid saturated colours
  - hue refers to the colour of the image itself,
  - saturation describes the intensity (purity) of that hue. when colour is fully saturated, it is purest (truest)
  - Use pastel colours
- Be consistent with expectations
  - Red means bad, green means go
- Use few colours
  - Too many colours look complex, cluttered, distracting

# Chromatic aberration

5

Different wavelengths focus differently

- E.g., red & blue can't be focused simultaneously

Is this sentence easy to read?

Is this sentence easy to read?

# Techniques for Contrast

6

- Manipulate appropriate visual variables
- - Brightness (intensity)
  - Hue
  - Texture
  - Shape
  - Position
  - Orientation
  - Size

# Why do we need contrast?

7

- Users need to select an item of a particular value (selectivity).
- Users need to compare items with different values (comparability).
- When there are multiple dimensions, users need the flexibility to ignore one dimension (disassociativity).

- Brightness
- Hue
- Texture
- Shape
- Position
- Orientation
- Size

**Nintendo NES System - Video Game Console** by

52 used from \$39.99

★★★★★ (79)

**See newer version of this game**

**Video Games:** See all 14,708 items

# Techniques for simplicity

10

- "Simplicity is the ultimate sophistication."  
Leonardo Da Vinci.
- Reduce - Hide or remove inessential component
- Regularize - Limit inessential variations
- Organize - Arrange controls in logical groups

# Reduce

11

# Regularise

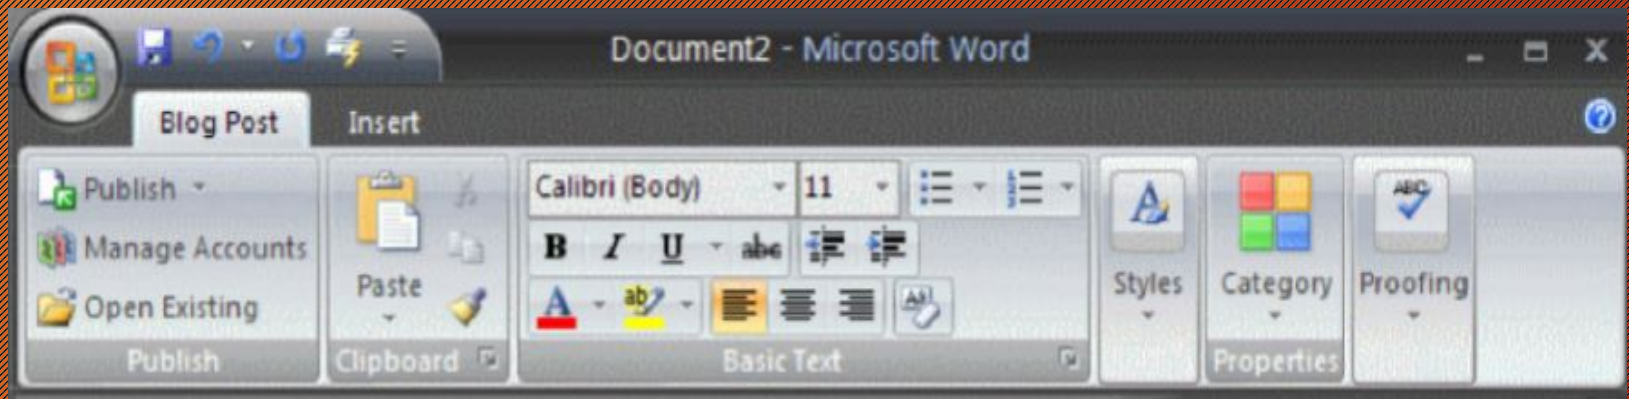

12

# Organise

13

# Grouping - Gestalt Principles

14

- The principles of grouping (or Gestalt laws of grouping) are a set of principles in psychology, first proposed by Gestalt psychologists to account for the observation that humans naturally perceive objects as organized patterns and objects, a principle known as Prägnanz.
- According to Gestalt psychology, the whole is different from the sum of its parts. Based upon this belief, Gestalt psychologists developed a set of principles to explain perceptual organization, or how smaller objects are grouped to form larger ones

# Grouping - Gestalt Principles

15

- Proximity
- Similarity
- Continuity
- Closure
- Figure & Background
- Symmetry
- --- Fancy way of saying “Grouping”
- Source:  
[https://wiki.cs.umd.edu/cmsc434\\_s10/images/b/be/L11-Visual-Design-Principles.pdf](https://wiki.cs.umd.edu/cmsc434_s10/images/b/be/L11-Visual-Design-Principles.pdf)

# Proximity

16

- *Proximity* occurs when elements are placed close together. They tend to be perceived as a group.
- The nine squares *below* are placed with and without proximity. Are they perceived as **separate shapes**?

# Similarity

17

- *Similarity* occurs when objects look similar to one another. People often perceive them as a group or pattern.
- The example below has 11 distinct objects but appears as a single unit because all of the shapes have **similarity**. Unity occurs because the triangular shapes at the bottom of the eagle symbol look similar to the sunburst shapes

# Continuity

18

- Continuation occurs when the eye is compelled to move through one object and continue to another object.
- Continuation occurs in the example below, because the viewer's eye will naturally follow a line or curve. The smooth flowing crossbar of the "H" leads the eye directly to the maple leaf.

# Closure

19

- *Closure* occurs when an object is *incomplete* or a space is not *completely enclosed*. If enough of the shape is indicated, people fill in the missing information.
- Although the panda below is not complete, enough is present for the eye to complete the shape. When the viewer's perception completes a shape, closure occurs.

# Figure & Background

20

- The eye differentiates an object from its surrounding area - a silhouette, or shape is naturally perceived as **figure** (object), while the surrounding area is perceived as **ground** (background).
- Balancing figure and ground can make the perceived image more clear. Using unusual figure/ground relationships can add interest and subtlety to an image.
- Here, the figure & ground relationships **change** as the eye perceives the form of a shade or the silhouette of a face.
